

What we built this round

And the small, doable things that come next. We are building this together - none of the list below is meant to land on you alone.

Your two big notes were: **Settings is showing every button twice**, and **the popups keep repeating**. Both are fixed, and three more things from your feedback board went in with them.

1. The moments feel alive now

What was wrong. There were only about eight moments in the whole system, and mood swings took up half of every roll. Worse, the blue menu in world always showed the same five buttons - Rub belly, Count kick, Water, Rest, Journal - no matter what had actually happened.

What it does now.

- **38 different moments** instead of eight, and mood swings are now about a third of them rather than half.
- **Every moment brings its own buttons.** Feeling sick offers ginger ale, a plain snack, medicine, or letting it happen. A kick offers talking to the baby or telling your partner. The blue menu builds itself from whatever that moment actually offers.
- **Whatever just happened cannot happen again.** Over an hour of play you now see 24 to 29 different moments with no repeats back to back.
- **They follow her body and her mood.** Low on water makes dizziness likely. No partner linked makes loneliness likely. Happy brings kicks and sweet daydreams. Each moment can leave her in a new mood, so it keeps flowing.
- **The tablet and the blue menu are the same moment.** Answer it in either place and it closes in the other.

2. Settings is a real settings screen

The old *Production buttons* panel is gone completely. Every button on it already had a home on its own tab - cravings now live on Nutrition, and the manual event roll moved into Settings.

In its place, five tabs she actually controls:

Tab	What she can change
Journey	Baby name, what you are expecting, how many real days the pregnancy takes.
Events	How often moments arrive, where they appear, and eight on/off switches for the kinds of moment she wants.
Sound	Master sound and volume, plus a switch for each in-world animation.
Privacy	Who can see the journey, public roleplay emotes, and exactly which kinds of news reach her partner.
Realism	How fast the meters move, whether pica cravings happen, and the hidden testing tools.

All of it is enforced on the server. Switching an animation off really stops it being sent - it is not just hidden on the screen.

3. Three more things straight off your board

No water during labour - ice chips only

You put this in its own box on your board, and it was only half true: her partner was blocked from bringing water, but she could still pour herself a glass. Now neither can, and the Care screen swaps the Water button for **Ice chips** the moment labour starts, with a little reminder line above it.

Food went from 19 items to 61

Every group on your board is now filled in properly:

Group	Now has	Some of what is in there
Breakfast	8	Eggs, pancakes, waffles, cereal, oatmeal, toast
Meals	11	Roast chicken, steak, fish, rice, soup, salad, pasta
Snacks	8	Crisps, crackers, cookies, popcorn, pretzels, granola
Fruits	9	Grapes, apple, banana, orange, pineapple, mango, peach
Drinks	9	Juice, milk, smoothie, tea, protein shake, coconut water
Desserts	8	Cake, cupcake, donut, brownie, cheesecake, pudding
Cravings	6	Pizza, pickles, buttery pasta, something spicy, olives
Corn starch & chalk	2	Both, and she can switch them off in Settings

Cravings also draw from a much wider pool now, and it changes by trimester - plain and sour early on, everything in the middle, heavy and icy at the end.

Every action has an animation slot now

This one is quietly important. Only four actions could ever play an animation. Sleep, being sick and contractions were all secretly playing the *resting* animation, and crying and the bathroom played nothing at all - so even if you had uploaded a crying animation, nothing would have used it.

Now all eleven have their own slot, with a sensible fallback until the real one exists. Animations also stop themselves when the next one starts, so being sick is a moment rather than a pose she gets stuck in.

One thing I need you to decide

Your board lists **Water Break** and **Birth** as buttons she can press. But we built labour so the server decides when it happens - it arrives on its own somewhere between week 37 and 42, and both HUDs find out in the same moment. Those two buttons were removed on purpose.

Both are reasonable. Which do you want?

- **Keep it as it is** - labour is a surprise, and nobody can rush it.
- **Bring the buttons back** - she can trigger these moments for a scene.
- **In between** - keep them as replay emotes that act out the moment in world without changing the real labour underneath. This is the one I would pick.

What is still to do

Grouped by what kind of work it is, so you can pick up whichever suits the day you are having.

Animations - the biggest gap, and the easiest to close

The script is already waiting for every one of these. Drop an animation into the HUD with the exact name below and it starts working. **No code, no script editing.** If a name is missing the HUD just skips it, so nothing ever breaks.

Animation name	Plays when	If missing	Priority
nestoria_rest	Rest, and stands in for others	-	Start here
nestoria_drink	Drink water, ice chips	-	Start here
nestoria_vitamins	Taking vitamins	-	Start here
nestoria_belly_hold	Holding and rubbing the bump	-	Start here
nestoria_cry	Crying, and emotional moments	nothing plays	High
nestoria_vomit	Being sick	rest plays	High
nestoria_sleep	Sleeping, napping	rest plays	High
nestoria_yawn	Sleepy and tired moods	rest plays	Medium
nestoria_bathroom	Bathroom break	nothing plays	Medium
nestoria_contraction	Contractions in labour	rest plays	Medium
nestoria_comfort	Comfort, with the chair	nothing plays	Later

The two that play nothing at all today are crying and the bathroom. Those are the ones where adding a file makes the most visible difference.

Sounds

Same rule - present means it plays, missing means it is skipped.

Sound name	Plays when	Priority
nestoria_chime	Notifications, hearts, vitamins	Start here
nestoria_heartbeat	Doctor, ultrasound, contractions	Start here
nestoria_sip	Drinking	High
nestoria_vomit	Being sick (falls back to the chime)	High
nestoria_cry	Crying	Medium
nestoria_yawn	Sleepy moods, going to sleep	Later

Good news: the tablet screen already makes its own sounds, and Second Life plays those through media audio. So the HUD is never silent even with no sound files at all. These are an upgrade, not a requirement.

Objects to build

Object	Status	What is needed
nestoria_chair	Script done	A cosy chair mesh. Required for Comfort.
nestoria_toilet	Script done	A toilet mesh, for the bathroom moment.
nestoria_hospital_bed	Script done	A bed mesh for labour and birth.
nestoria_hospital_bag	Script done	A bag she or her partner wears.
nestoria_mess	Not started	New. The little pile on the floor after being sick. Needs a small mesh and a tidy-up script - we will write that one together.
Food props	Script done	Hand-held foods, drinks, vitamins.

Plugging each button through to the world

This is the honest gap between where we are and the sentence at the top of your board: *"I want the buttons to actually perform actions in world whenever possible, not just change meters."*

Right now most buttons do three of the four things: they move the meters, write a lovely roleplay line, and tell her partner. The fourth - **something visibly happening in world** - is done for some and not others.

Button	Where it stands
Rest, Water, Vitamins, Bump	Fully wired. Animation, sound, meters, line.
Comfort	Chair rezzes and she sits. A comfort animation would finish it.
Bathroom	Toilet rezzes. Needs the animation.
Being sick	Particles and mess object. Needs the animation, the sound, and the tidy-up script.
Cry	Line only today. Needs animation and sound.
Sleep	Borrows the rest animation. Needs its own.
Feel kick / Count kick	Logs the kick and tells her partner. Count kick is still one press per kick, not a proper counting session yet.
Appointment	Writes a journal entry. No in-world visit yet - no scene, no time set, no way for her partner to attend that particular one.
Ultrasound	Unlocks the photo and plays the heartbeat. Not a scene the two of them attend together yet.
Contractions, hospital, birth	Fully wired through the bed. Both HUDs stay in step.

The two worth doing next are Appointment and Ultrasound. They are the only places on your board where a whole scene is described and we currently only write a diary entry.

Your next few steps

Small on purpose. Each one is finishable in a sitting, and each one makes something visibly work. You do not have to do them in order, and you definitely do not have to do them all.

1

Re-save the HUD script about 5 minutes

Open your HUD in world, open the script inside it, and paste in the new `lsl/nestoria_main_hud.lsl`. Check the two lines at the top still have your correct web address and secret, then Save.

Why it matters: Until you do this, the blue menu in world still shows the old five buttons for every event. Everything else is already live.

2

Find one animation - start with crying about 20 minutes

Search the Marketplace for *full perm animation crying* or *full perm emotion animations*. Buy one, rename it exactly `nestoria_cry`, and drop it into your HUD's contents. Nothing else needed.

Why it matters: Crying is the only action that plays nothing at all right now, so adding it is the single most noticeable change you can make today.

3

Test that it worked about 2 minutes

Touch your HUD, go to **Care**, and press **Cry**. If your avatar cries, you just shipped a feature on your own.

Why it matters: Getting one thing working end to end teaches you the whole pattern. Every other animation works exactly the same way.

4

Do the same for two more about 30 minutes

Repeat step 2 for `nestoria_vomit` and `nestoria_sleep`. Same idea, same folder, exact names.

Why it matters: These two are currently borrowing the resting animation, which is why being sick looks like sitting down calmly.

5

Build the mess prim about 30 minutes

Make a small flat prim, put a food-ish texture on it, and name it `nestoria_mess`. Take it to your inventory and drop it in the HUD. Do not worry about making it disappear again - that is a script, and we will write it together.

Why it matters: It is the fourth of the five steps you drew for the vomiting sequence, and it is a nice gentle piece of building practice.

6

Play for twenty minutes and take notes about 20 minutes

Turn the events on, potter about, and write down anything that felt repetitive, wrong, or interrupted you when it should not have.

Why it matters: You are the only person who knows how it is meant to feel. A note like "this line came up twice and felt odd" is worth more than any bug report.

If any of that gets stuck, stop and send it to me. Getting stuck for twenty minutes is normal and is not a sign you have done anything wrong.

In-world testing checklist

Work down the list with a friend on the Partner HUD. Tick as you go, and note anything that does not do what the right-hand side says.

Before you start

Both of you, before anything else.

- ☐ Viewer: Preferences, then Sound & Media, then Media - turn media on and allow it to auto-play.
- ☐ The new HUD script has been pasted in and saved (step 1 on the last page).
- ☐ Touch the HUD. The tablet screen loads. If it stays blank for 30 seconds, touch it again - the server may be waking up.

Pairing

- ☐ She completes the setup wizard and reaches the home screen.
- ☐ More, then Partner - a six-character code appears.
- ☐ He wears the Partner HUD, touches it, and enters her code.
- ☐ She sees an approval card and accepts it.
- ☐ His HUD now shows her week, her mood, and how she is doing.

The moments

This is the part that was rebuilt - please be picky here.

- ☐ Settings, then Events. Set the frequency and choose HUD screen plus in-world menu.
- ☐ Press Give me a moment now. A card appears at the top of the tablet AND a blue menu pops up.
- ☐ The buttons on both match each other, and they suit what just happened.
- ☐ Answer it from the blue menu. The card disappears.
- ☐ Press it ten times. You get ten different moments - never the same one twice running.
- ☐ Answer one on the tablet instead. The blue menu for that same moment now says it has passed.
- ☐ Turn off Mood swings and Sickness. Roll ten more - nothing from those two appears.
- ☐ Set it to HUD screen only. The card appears, no blue menu.
- ☐ Set it to quiet mode. Nothing interrupts, but the moment still appears in Alerts.

Settings that should really work

- ☐ Sound off - the buttons go silent. Volume at 20 percent - noticeably quieter.
- ☐ Turn off the vomiting animation. Care, then Be sick - meters still change, no particles.
- ☐ Turn off the bathroom prop. Care, then Bathroom - relieves the meter, nothing rezzes.
- ☐ Privacy: turn off Mood swings under what reaches your partner. He stops being pinged about them.
- ☐ Realism: set it to Gentle. The meters visibly drift more slowly.
- ☐ Turn off pica cravings. Corn starch and chalk never come up again.

Food and cravings

New this round - 61 items.

- ☐ Nutrition shows all eight groups, and none of them look thin.
- ☐ Roll a craving. It names something real, and the five choices work.
- ☐ Eat the thing she is craving. The craving eases and her mood lifts.
- ☐ Roll several cravings - you do not get the same one over and over.

Partner interactions

Water, vitamins and rest land straight away. Hugs, kisses, back rubs and feeling a kick ask her first.

- ☐ He checks on her - he gets a summary in words, limited to what she allows.
- ☐ He brings water, brings vitamins, helps her rest - these land immediately.
- ☐ He sends a hug - she gets a request card and nothing happens until she answers.
- ☐ She accepts one, then declines the next. Both are handled politely.
- ☐ She turns off Hug, kiss, feel kicks in her privacy settings. He is told why it will not work.
- ☐ He tries to feel the baby kick with no recent kick - refused. He reacts to kicks, never causes one.
- ☐ She logs a kick. He tries again within ten minutes - it works.
- ☐ They both tick hospital bag items. Each shows who packed it, live on both screens.

Labour and birth

Settings, Realism, Testing - enter the code nestoria-test to unlock the tools.

- ☐ Jump to week 38. The week updates on both HUDs.
- ☐ Set labour speed to 25 times, then press Start labour now.
- ☐ Within seconds, contractions begin - and HIS HUD tells him on its own.
- ☐ IMPORTANT: her Care screen now shows Ice chips where Water used to be, with a reminder line.
- ☐ She tries to drink water some other way - she cannot. Ice chips only.
- ☐ He tries to bring water - refused, and told to offer ice chips instead.
- ☐ He brings ice chips - now available, and it works.
- ☐ He comforts her, guides her breathing, holds her hand. Her stress drops.
- ☐ Her waters break, then Time for the hospital - both are told.
- ☐ Transition, then pushing. Intensity climbs to 100 percent.
- ☐ He tries Faint or Stay strong - it plays on HIM, never on her.
- ☐ The baby arrives. Both HUDs announce it together.
- ☐ Press Reset labour, then Turn off and restore. ALWAYS do this last.

**Then tell me**

- ☐ Anything that did nothing when you pressed it.
- ☐ Any moment that came round too often, or read oddly.
- ☐ Anything that interrupted you when it should not have.
- ☐ Anything that felt lovely - genuinely useful to know, so we keep it.

Thank you for the feedback board. It is the reason all of this got built in the right order.
